

Poster – #EIE2021

How to feed science into a complex policy-ecosystem: what change models work in the world of health technology assessment and why?

*Presenter: Ayla Lokhorst (Zorginstituut Nederland) – **Netherlands***

*Co-authors: Milou Hogervorst (Utrecht University) & Diana Delnoij (Zorginstituut Nederland) – **Netherlands***

Research aim

Highlighting the advantages and disadvantages of different change management models. The goal is to help project leaders stimulate international consensus and inter-stakeholder collaboration concerning the implementation of new data sources and methods for making policy decisions in health technology assessment (HTA) practice.

Methods

Literature/scoping review.

Key findings

The project is prospected to provide a range, a menu, of possible change models for HTA practice from which project leaders can choose or be inspired. We will describe categories of change models and the (dis)advantages for a project operating in a complex, international environment with multiple stakeholders.

Discussion

Have you ever consciously used a change management method to change something in your work? Did it work or not and what factors helped or hindered this change?

Do you think there should be a difference in implementation strategy when implementing something in the world of patient care or implementing something in policy?
